Overview

This is a writeup for VulnHub VM [Brainpan: 1](#). Here's an overview of the `enumeration` → `exploitation` → `privilege escalation` process:

Phase #2: Exploitation

1. BoF in a vulnerable service running on 9999/tcp. File for the vulnerable service is available for download via a HTTP server running on 10000/tcp. Analyze the service, create exploit and gain remote access to VM.

Phase #3: Privilege Escalation

1. There's a binary, `anansi_util` that allows `sudo` access. Running the service, we see that it has 3 options, one of which is to view `man` page for any command. We use this option to escape to shell.
